

Using parameters to make visualizations more interactive

Business problem 1: Allow users to select the field against which they want to compare the sales value.

Create parameters where we display the fields that they can have on the y axis

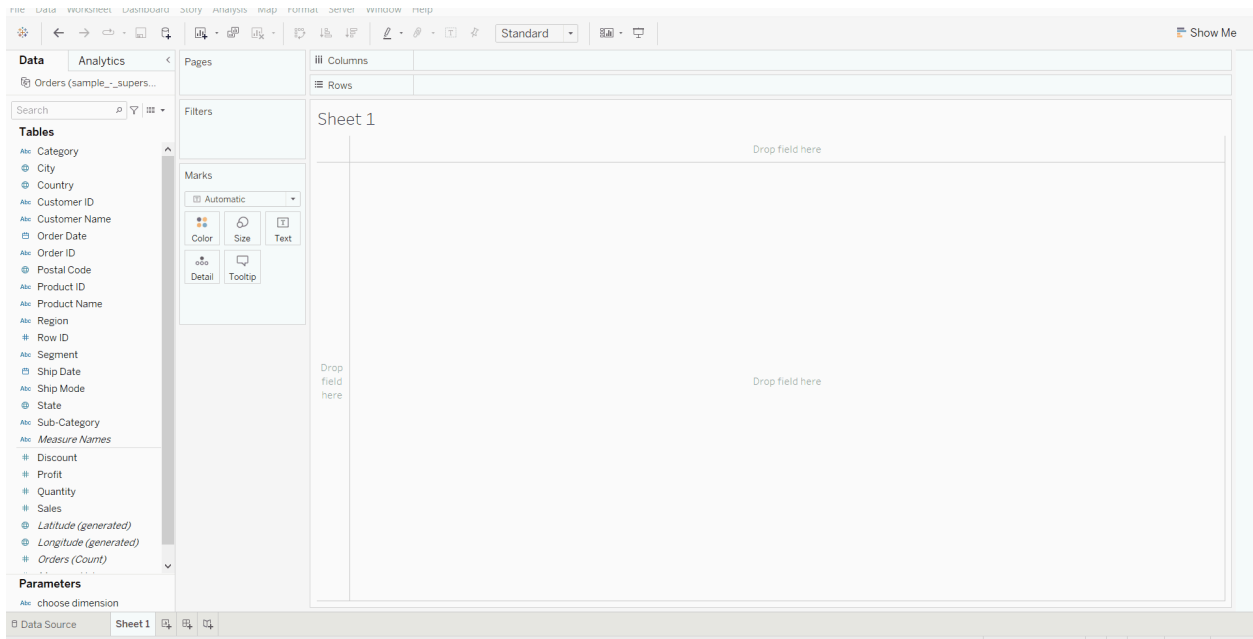

Creating a calculated field that will help us select the correct dimension based on the parameter value selected

Formula:

```
CASE [choose dimension]  
WHEN 'customer'  
THEN [Customer Name]  
WHEN 'product'  
THEN [Product Name]  
WHEN 'state'  
THEN [State]  
END
```

Note- the strings in the above formula have to match the string that we had entered when creating the parameter otherwise it won't work

Solving the problem
