$L_2\text{-reg!}$

$$\boxed{w^T z_i + w_0}$$

$$\min_{w_j} \text{loss} + \lambda \sum_{j=0}^d (w_j^2)$$

Winge-loss; Huber-loss  
log-loss; sq.loss

Recap:  $L_1\text{-reg}$

reg: avoid overfitting

$L_1\text{-reg}:-$

①

$\begin{cases} d > n \\ \text{almost non-zero weights} \\ \text{zero} \end{cases}$

$L_1\text{-reg}$  embodies

$$\min_{w_j} \text{loss} + \lambda \sum_{j=0}^d |w_j|$$

$\|w\|_1$

Sparsity  $\Rightarrow$  all the less useful  $f_j$ 's weights will become zero

② correlated features

$\downarrow$  only one  $w_j = \text{non-zero}$  (intuition in paev-class)  
rest all zero

$(\lambda_1 \& \lambda_2) \uparrow \Rightarrow$  avoid overfitting

$\min_{w_j}$  loss +  $\lambda_1 \sum_{j=0}^d w_j^2$

$\{ \lambda_2 \uparrow \text{ as compared to } \lambda_1 \}$

$\Rightarrow$  more sparsity

$\lambda_1, \lambda_2 \uparrow: \text{reduce overfitting}$

Elastic Net:

$$\text{loss} + \lambda_1 \sum_{j=0}^d |w_j| + \lambda_2 \sum_{j=0}^d w_j^2$$

$\lambda_1$   $\lambda_2$

Ridge Tikhonov

$$\min_{w_j} \text{loss} + \boxed{\lambda_1} \sum_{j=0}^d w_j^2 + \boxed{\alpha \cdot \lambda_1} \sum_{j=0}^d |w_j|$$

$\alpha \uparrow \Rightarrow \alpha \lambda_1 \uparrow \Rightarrow$  more sparsity

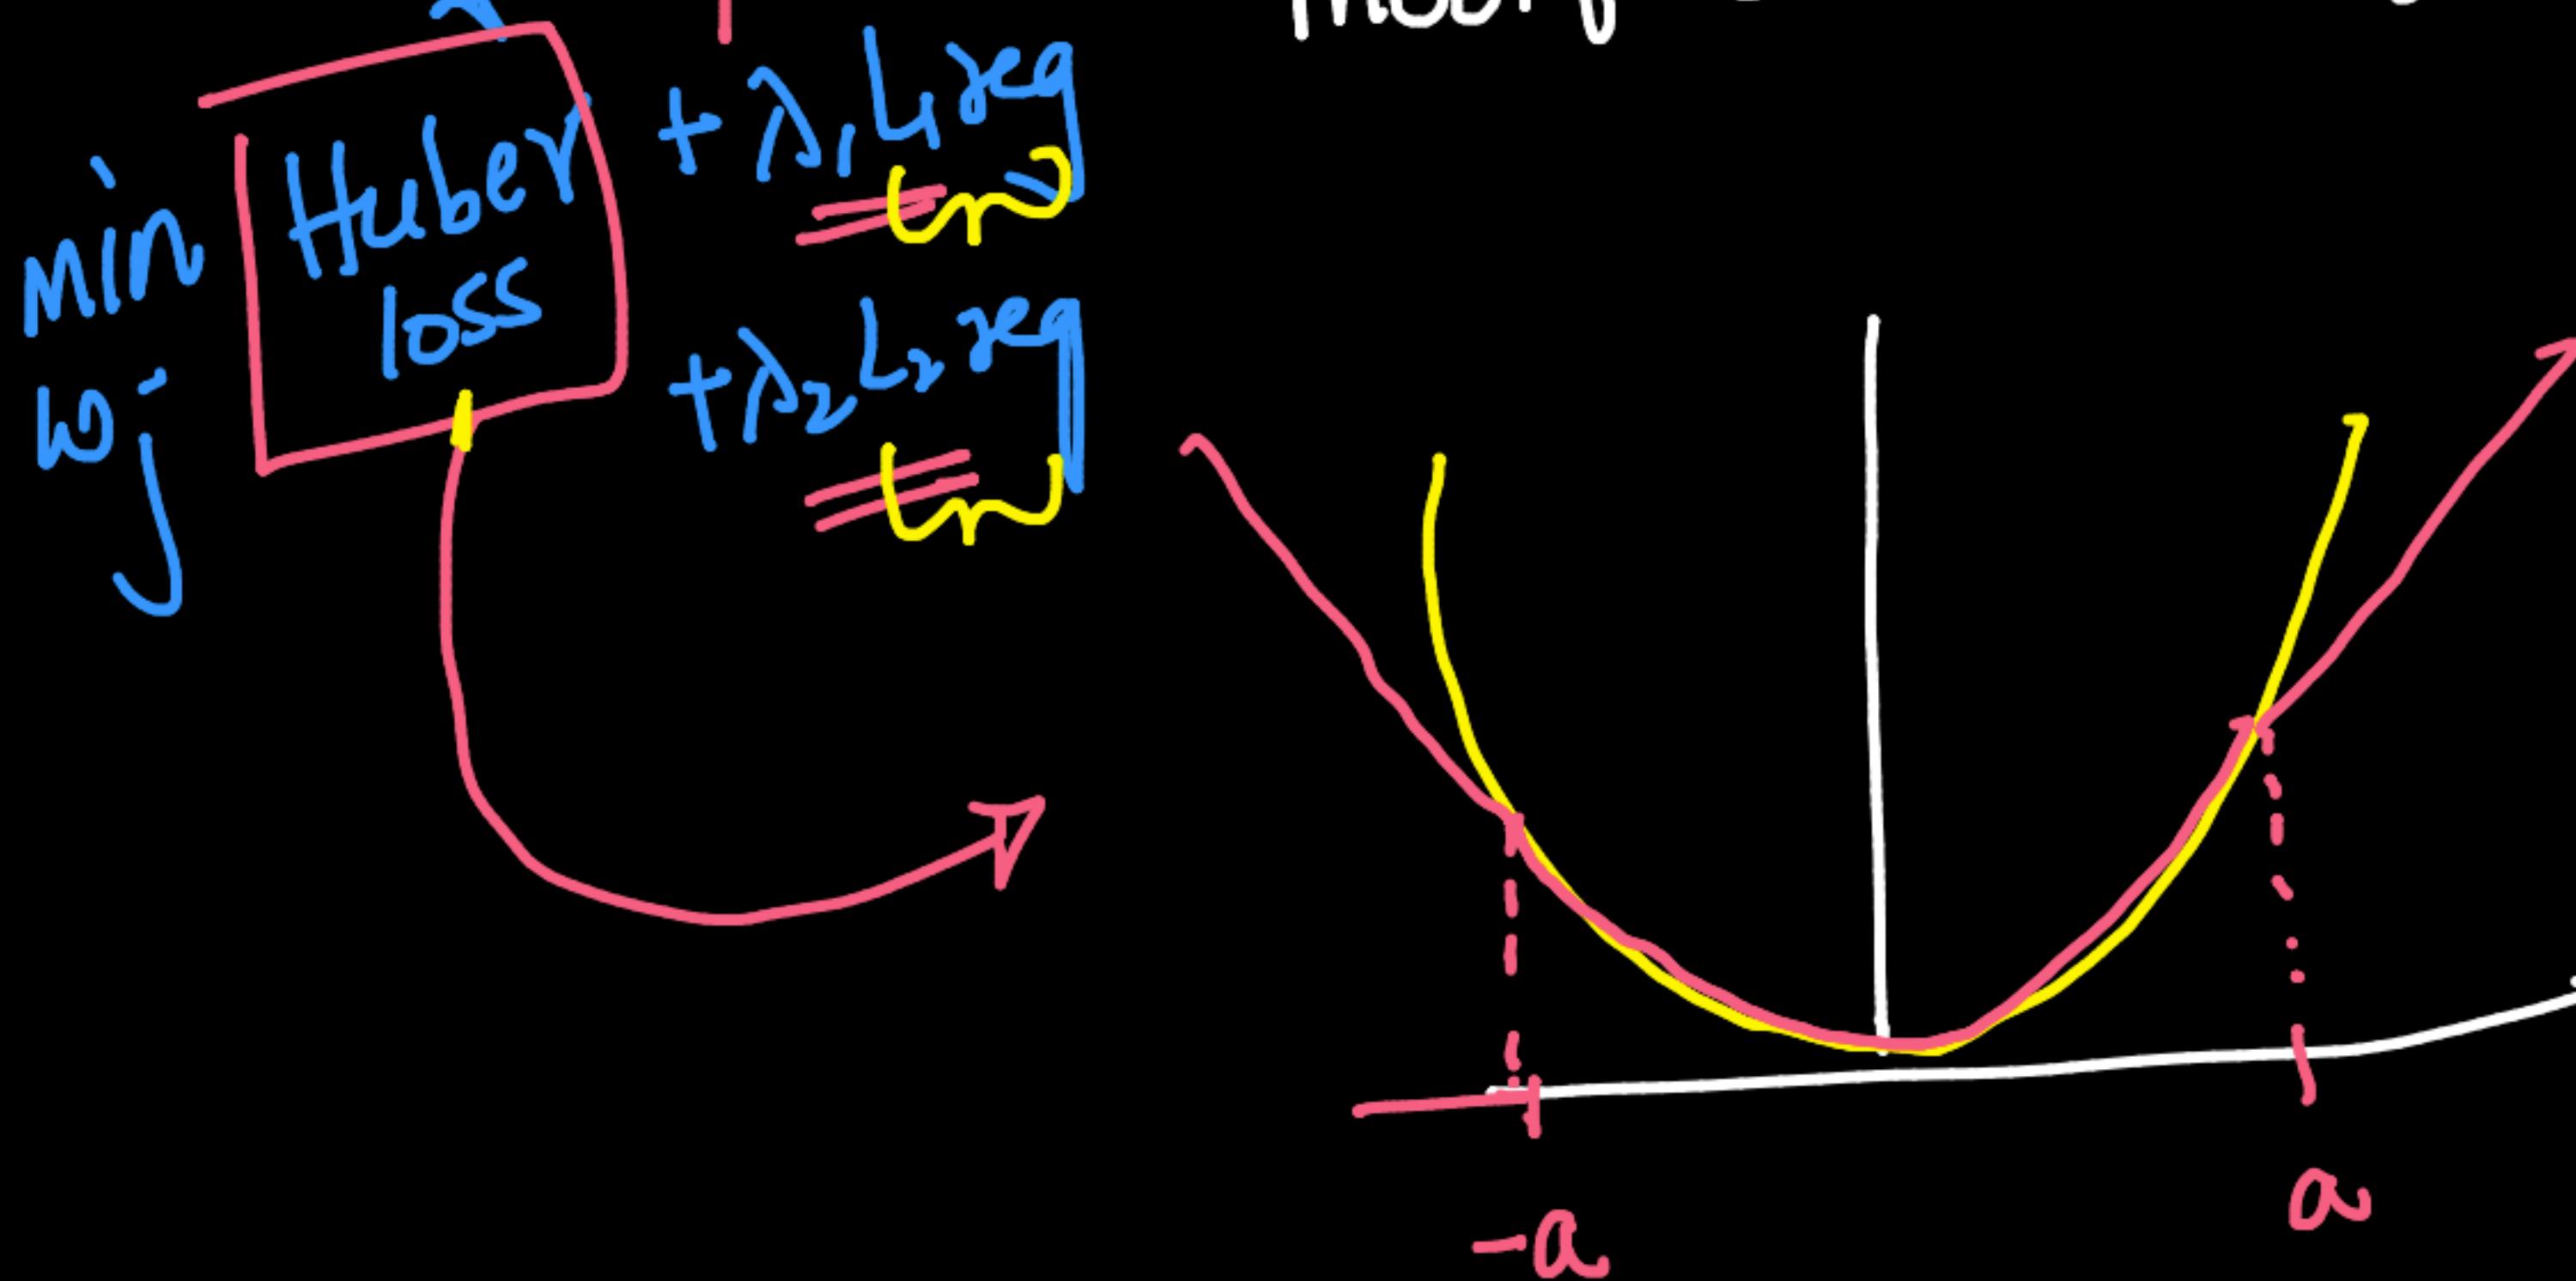

$\lambda_1 \uparrow$ : less overfit

$\alpha \uparrow$ : " " + more sparse models

→ less impacted by outliers  
Huber-loss: -  $\lambda_1 L_1 \text{reg}$   $\times$

$\min_w$  Huber loss +  $\lambda_1 L_1 \text{reg}$   
+  $\lambda_2 L_2 \text{reg}$  ↪ modified SQ.loss for robustness

$$\underline{e}_i = \hat{y}_i - \hat{y}_i$$

$$\min \text{ loss} + \lambda (\text{reg})$$

log-loss

SQ-loss

Huber-loss

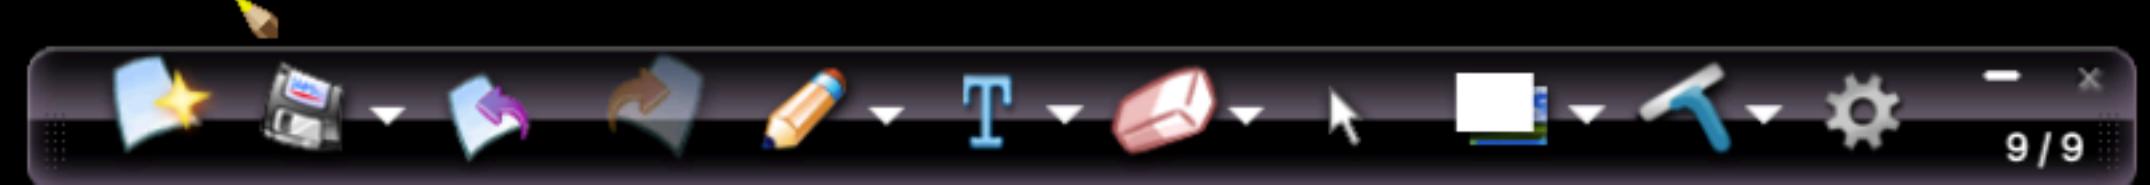

Hinge-loss

[Other versions](#)

Please [cite us](#) if you use the software.

[sklearn.linear\\_model.LogisticRegression](#)

Examples using [sklearn.linear\\_model.LogisticRegression](#)

supported by the 'saga' solver.

Read more in the [User Guide](#).

### Parameters:

**penalty : {'l1', 'l2', 'elasticnet', 'none'}, default='l2'**

Specify the norm of the penalty:

- '**none**' : no penalty is added;
- '**'l2'**' : add a L2 penalty term and it is the default choice;
- '**'l1'**' : add a L1 penalty term;
- '**'elasticnet'**' : both L1 and L2 penalty terms are added.

**Warning:** Some penalties may not work with some solvers. See the parameter `solver` below, to know the compatibility between the penalty and solver.

*New in version 0.19: l1 penalty with SAGA solver (allowing 'multinomial' + L1)*

### **dual : bool, default=False**

Dual or primal formulation. Dual formulation is only implemented for l2 penalty with liblinear solver. Prefer dual=False when n\_samples > n\_features.

### **tol : float, default=1e-4**

Tolerance for stopping criteria.

Examples

```
>>> from sklearn.datasets import make_regression
>>> from sklearn.isotonic import IsotonicRegression
>>> X, y = make_regression(n_samples=10, n_features=1, random_state=41)
>>> iso_reg = IsotonicRegression().fit(X, y)
>>> iso_reg.predict([.1, .2])
array([1.8628..., 3.7256...])
```

Methods

**fit(X, y[, sample\_weight])** Fit the model using X, y as training data.

**fit\_transform(X[, y])** Fit to data, then transform it.

**get\_feature\_names\_out([input\_features])** Get output feature names for transformation.

**get\_params([deep])** Get parameters for this estimator.

**predict(T)** Predict new data by linear interpolation.

**score(X, y[, sample\_weight])** Return the coefficient of determination of the prediction.

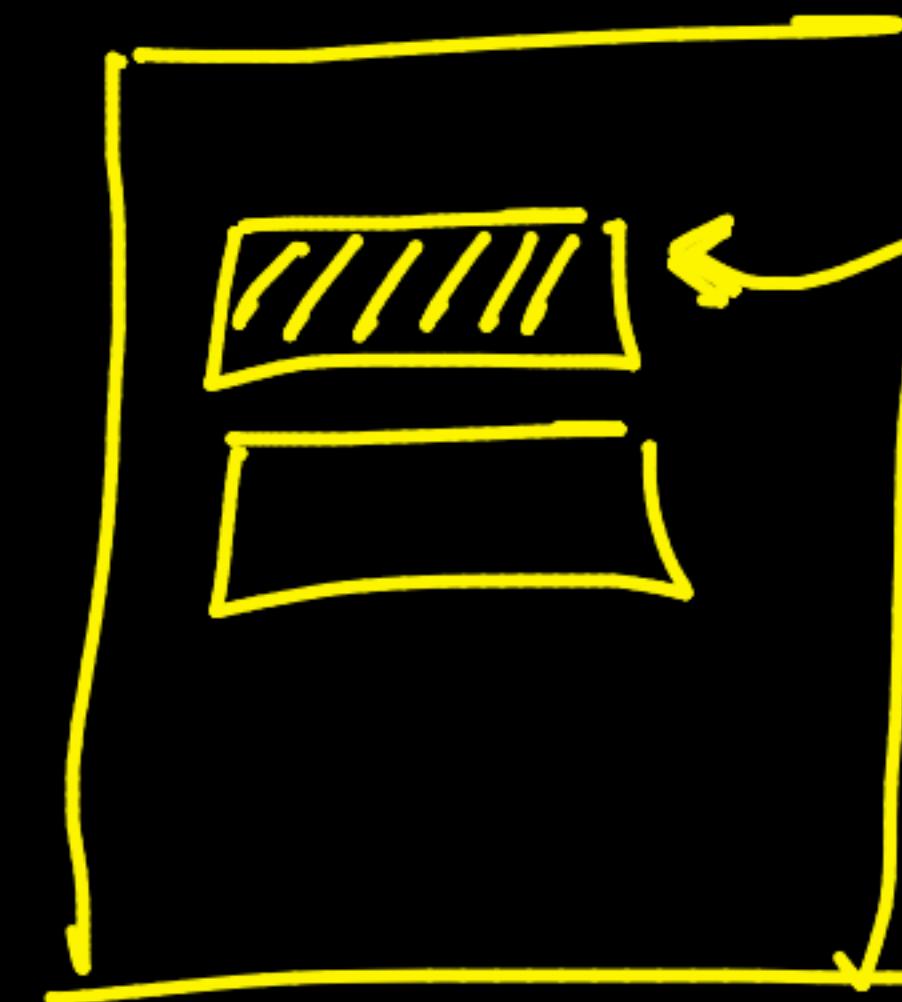

**set\_params(\*\*params)** Set the parameters of this estimator.

### Gain Chart

The Gain Chart displays the percentage of cumulative events versus the percentage of data sets. The Y-axis represents '% of events' from 0 to 100, and the X-axis represents '% of data sets' from 0 to 100. Two series are plotted: '% of cumulative events (model)' (blue line with diamonds) and '% of cumulative events (random)' (red line with circles). The model curve rises steeply initially, reaching nearly 100% events by 50% of data sets, while the random curve rises more gradually to about 100% at 100% data sets.

% of data sets	% of cumulative events (model)	% of cumulative events (random)
0	0	0
10	45	10
20	82	20
30	88	30
40	92	40
50	94	50
60	95	60
70	96	70
80	97	80
90	98	90
100	100	100

### Lift Chart

The Lift Chart shows lift values across deciles. The Y-axis is 'Lift' from 0.0 to 5.0, and the X-axis is '% of data sets' from 0 to 100. The 'Lift (Model)' (blue line with diamonds) starts at approximately 4.5 for the first decile and decreases steadily to about 1.2 for the 10th decile. The 'Lift (Random)' (red line with circles) remains constant at a value of 1.0 across all deciles.

% of data sets	Lift (Model)	Lift (Random)
0	4.5	1.0
10	4.0	1.0
20	3.0	1.0
30	2.3	1.0

**Gain Chart**

The Gain Chart displays the percentage of cumulative events for a model compared to a random distribution. The x-axis represents the percentage of data sets from 0% to 100%, and the y-axis represents the percentage of events from 0% to 100%. The blue line with diamond markers represents the model's performance, while the red line with circle markers represents a random distribution. The model's curve rises much faster than the random baseline, indicating effective model selection.

% of data sets	% of cumulative events (model)	% of cumulative events (random)
0	0	0
10	45	10
20	82	20
30	88	30

60	95	60
70	96	70
80	97	80
90	98	90
100	100	100

**Lift Chart**

The Lift Chart compares the lift provided by the model against a random distribution. The x-axis represents the percentage of data sets from 0% to 100%, and the y-axis represents lift values from 0.0 to 5.0. The blue line with diamond markers shows the model's lift, which starts at approximately 4.5 for the first decile and decreases rapidly before leveling off around 1.2. The red line with circle markers represents a random distribution, which remains flat at a lift value of 1.0 across all deciles.

% of data sets	Lift (Model)	Lift (Random)
10	4.5	1.0
20	4.0	1.0
30	3.0	1.0
40	2.2	1.0
